

# Dell Performance Analysis Collection Kit

## Report Title: 201509\_Storage-1

For Mercateo AG

This document is an assessment of the server and storage workloads as observed at Mercateo AG based on servers, server disk activity, and storage capacity. The data depicted in this report may be used to make recommendations on future configurations and solutions.

This report may be used to identify times of peak IO activity, and marks the critical 99th IOPS thresholds, a key metric used as a baseline for storage sizing. This report includes details on servers, CPU and memory usage, as well as free and used storage capacities.

If you have any questions regarding the information presented in this report, please contact your Dell team for immediate assistance.

# Aggregate Output

Time Recorded	7 Day(s), 0 Hour(s), 0 Minute(s), 8/18/2015 - 8/25/2015
Servers Recorded	64

## Output Summary

Throughput	1299 MB/s
IOPS	20245 at peak, 11973 at 99%
Read/Write Ratio	58% / 42%
Total Local Capacity	112.66 TB
Free Local Capacity	66.46 TB (59%)
Used Local Capacity	46.20 TB (41%)
Total Cores	411
Total Processors	164

# Individual Server Report: adama70

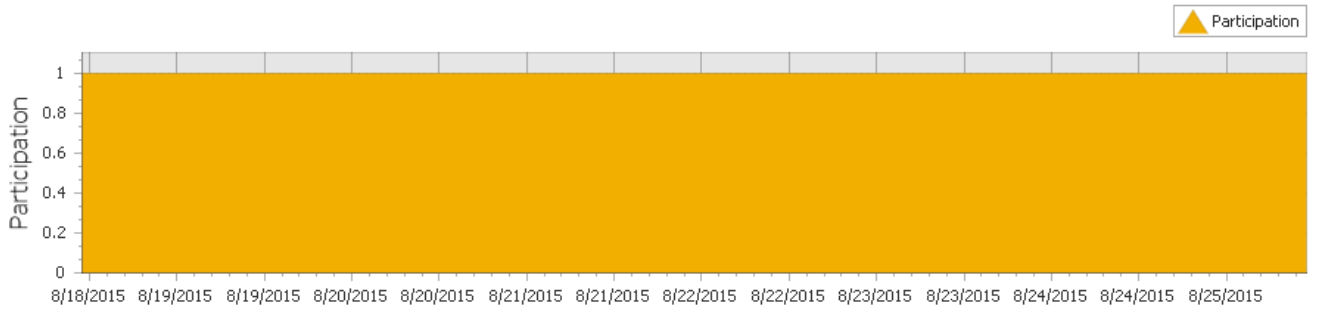

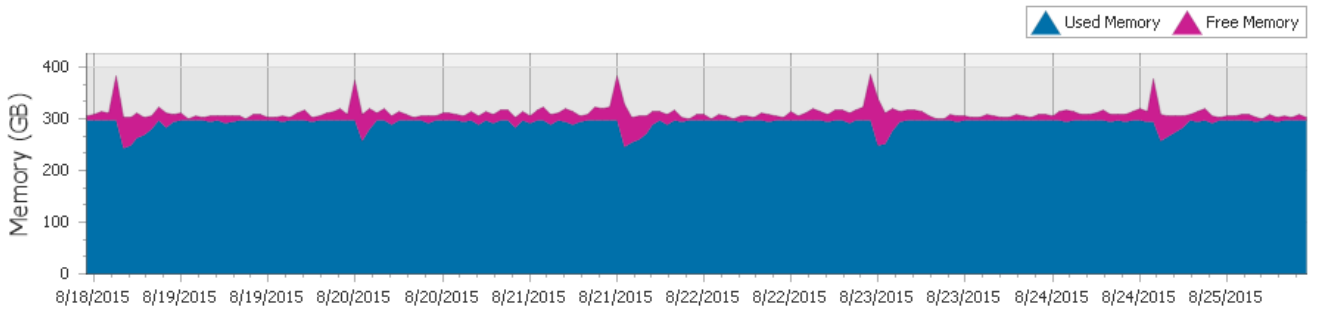

Operating System	CentOS release 6.4 (Final)
Time Recorded	7 Day(s), 0 Hour(s), 0 Minute(s), 8/18/2015 - 8/25/2015

Output Summary		Output Summary	
Throughput	182.10 MB/s	Average IO size	Read: 18.18 KB / Write: 208.84 KB
IOPS	698 at 99%	Latency	22 ms Reads and 101 ms Writes
Read/Write Ratio	96% / 4%	Average Queue Depth	2.28
Total Local Capacity	4.96 TB	Peak/Min CPU	84% / 4%
Free Local Capacity	1.65 TB (33%)	Peak/Min Memory	90.76 GB / 0.70 GB
Used Local Capacity	3.31 TB (67%)	Peak/Min Memory In Use	296.91 GB / 206.86 GB

Sockets	Cores	Description
2	12	Intel(R) Xeon(R) CPU X5650 @ 2.67GHz

Capacity shown only reports capacity that is local to the server. Shared Cluster Disk capacities are not shown in this table. IOPS shown are based on the 99th percentile IOPS for the individual server. As each server's individual 99th percentile may occur at different times than other servers, adding up the individual server 99th percentiles will not be the same as the summary aggregate 99th percentile IOPS for the entire report. The IOPS shown include any IO to shared cluster disks.

The Read and Write ratios shown represent the ratios during the top 10% of the server's IO activity as measured by IOPS.

Capacity shown only reports capacity that is local to the disk. Shared Cluster Disk capacities are not shown in this table. IOPS shown are based on the 99th percentile IOPS for the individual disk. As each disk's individual 99th percentile may occur at different times than other disks, adding up the individual disk 99th percentiles will not be the same as the summary aggregate 99th percentile IOPS for the entire report.

The Read and Write ratios shown represent the ratios during the top 10% of the disk's IO activity as measured by IOPS.

---

## Definitions

---

### CPU:

The CPU shown in the individual server reports measures the utilization of the CPU as a percentage of the total available CPU clock cycles. When shown in the aggregate summary, the CPU aggregate represents the sum of the clock cycles utilized.

### IO Transfer Size:

This unit of measure records the average payload size of a given set of read or write operations. The average IO transfer size may be used to describe the nature of the IO workload and is an important factor in understanding the character of an IO workload.

### IOPS:

DPACK monitors the read and write operations at the block storage layer of the host operating system. IOPS are the Input / Output Operations per Second performed by a physical server host or a virtual machine.

### Latency:

The average time required for the host to complete an IO operation is measured as its average latency. DPACK monitors latency at the host level. Like queue depth, the host's latency will differ from latency reported by external storage arrays, and individual disks within RAID sets. Intermittent spikes in latency should not be a matter of concern. Also, average latency reported in DPACK is only accurate when the sustained IOPS are over 100 IOs per second. High latencies reported during very low periods of IOPS should be discounted and often can be attributed to counter skew factors associated with the latency calculation. Latency is an important factor when investigating a storage solution that is demonstrating known problems at the application layer. Most applications will not tolerate abnormally high levels of latency on a sustained basis.

### MB/s:

Megabytes per second represents the average rate of read and write IO transfers in terms of payload size per second. This measures the IO throughput of a given system and is an important factor in sizing storage network bandwidth requirements.

### Memory:

The memory shown in the individual server reports measures the total available (free) and used memory for the server. When shown in the aggregate summary, the total memory shown represents the aggregate memory usage (and free memory) of all servers in the report.

### Participation:

This simple chart shows the number of servers that were monitored for the given sampling period. If the connection between DPACK and a server was lost, the participation chart will show a drop during the period when the server was out of communication with DPACK.

### Queue Depth (QD):

The number of outstanding IO operations that are the host is processing at any given time is the queue depth. DPACK monitors queue depth at the host level. Host level queue depth will differ from the queue depth reported by external storage arrays, and individual disks within RAID sets. Storage devices tend to perform faster when queue depths are higher. However, high queue depths can also lead to higher than acceptable latencies.
